

IN THE SPECIFICATION

Please amend paragraph 5, on page 2 of the subject application as indicated below:

One programming language requiring precise exception reporting is Java (™). Java (™) which was developed by Sun Microsystems, Inc. of Palo Alto, California has become very popular. One advantage of Java (™) is that it is a compact platform-neutral-object-oriented programming language that, when compiled, represents instructions as platform-independent byte codes. These byte codes can be translated using a compiler such as the Just-In-Time (™) (JIT) compiler, that converts the Java (™) byte codes into instructions within the native instruction set of a particular hardware platform.
